We consider the basic problems, notions and facts in the theory of entire functions of several variables, i. e. functions $J(z)$ holomorphic in the entire n space. First, for $n = 1$ the zero set of an entire function is not discrete and therefore one has no analogue of a tool such as the canonical Weierstrass product, which is fundamental in the case $n = 1$. Second, for $n > 1$ there exist several different natural ways of exhausting the space
