The book gives an overview of the clinical developments in the use of bisphosphonates in clinical oncology. The first part presents the composition, physiology, and pathophysiology of bone. Next is a section giving insight into mechanisms of bone resorption, bone formation, and bone remodeling, a field in which I was most influenced by O. L. M. Bijvoet and H. Fleisch. The second part summarizes the pharmacological treatments for disorders of bone remodeling. The clinical aspects of tumor-induced hypercalcemia and its management are described in detail, including our first prospective randomized crossover study testing pamidronate versus mithramycin. The bisphosphonates were introduced in clinical oncology by endocrinologists. The same was true for our institution in 1986, when P. Burckhardt proposed testing pamidronate in the above-mentioned trial in his institution (CHUV) and in our department. The impressive results obtained in the hypercalcemia trial stimulated our interest, and we actively investigated the use of pamidronate to counteract osteolytic bone destruction in cancer patients. These investigations are presented and discussed in the third part. They represent the interdisciplinary work involving many co-workers of the Department of Internal Medicine C and other institutes of the Interdisciplinary Oncology Center St. Gallen (IOSG), which I was privileged to chair for 10 years. Initially, a pharmacokinetic study was performed in order to optimize and facilitate the administration of the drug to patients with malignant osteolytic bone disease.
